

Website Performance & SEO Audit

with a Prioritized Optimization Plan

transformpersonaltraining.com • transformfitcoach.com

Prepared for	Dave Bostik, Transform Personal Training
Date	June 8, 2026
Scope	Full technical, on-page and local SEO audit of both domains, live performance benchmarking, keyword research, and a phased action plan.
Platform	Astro static site (v4.16) on LiteSpeed hosting, GoHighLevel lead forms
Method	Live in-browser measurement, full source-code review, structured-data and crawl checks, public keyword research.

The one-line summary

Your site is fast and technically clean. The ranking upside is in **local SEO** and in **fixing the 87 blog posts**, which are 92% of your pages but are missing meta descriptions, have broken heading structure, and carry no article schema. None of this requires a rebuild, just targeted edits.

Part 1 | Analysis & Benchmark Report

1.1 Executive summary

Transform runs as a modern Astro static website served over HTTPS from LiteSpeed hosting, with GoHighLevel handling lead-capture forms. The second domain, transformfitcoach.com, forwards to transformpersonaltraining.com, so this is a single site reachable from two domains rather than duplicate sites.

On **performance**, the site is in excellent shape. Measured live, the homepage paints in well under 0.2 seconds, has zero layout shift, and ships only about 127 KB across 13 requests over HTTP/2 with Brotli compression. Speed is a strength, not a problem, so the plan deliberately spends little effort there.

On **SEO**, the fundamentals on the eight main pages are solid: unique titles and descriptions, single H1s, alt text on every image, a working robots.txt and sitemap, and LocalBusiness plus FAQ schema on the homepage. The gap is in three places: there are no canonical tags anywhere, no social-share (Open Graph) tags anywhere, and the 87 blog posts that make up the bulk of the site are badly under-optimized. You are also not yet set up to measure results. Fixing these is high impact and low risk because the site is code you control.

Where the ranking upside is

1. **Local SEO** for Lakeview, Lincoln Park and nearby neighborhoods, plus Google Business Profile and reviews. This is where intent and conversion are highest and competition is most beatable.
2. **The blog**: 87 posts with real word counts but empty descriptions, stray H1s, and no article schema. Cleaning these up unlocks a lot of latent organic traffic.
3. **Measurement**: connect Search Console and GA4 so you can see queries, clicks and conversions and optimize with data instead of guesses.

1.2 How the site is built and how it functions

Understanding the stack matters because it determines how fixes get made. Key facts from the source code and live behavior:

- **Framework**: Astro 4.16, a static-site generator. Pages are pre-built to HTML in a /dist folder, which is why the site is so fast. Styling is Tailwind plus a custom design-tokens CSS.
- **Content model**: 8 main pages as .astro files, and 87 blog posts as Markdown files in src/content/blog. All blog posts share one layout, BlogPost.astro, so a single edit there changes every post.
- **Hosting**: LiteSpeed web server. An .htaccess file rewrites requests into the /dist folder and enforces trailing slashes. It does not currently handle HTTPS, www, the cross-domain redirect, or caching, so those are set at the host or domain level.
- **Lead capture**: GoHighLevel (LeadConnector) embedded forms power the 'Schedule Free Consultation' and contact flows. The homepage logs a console error, '[GHL Styled] Iframe not found', which is worth checking because a broken primary form silently costs leads.
- **Sitemap & robots**: Both present. The sitemap lists 95 URLs and is referenced from robots.txt, which allows full crawling.
- **Domains**: transformfitcoach.com forwards to transformpersonaltraining.com. Confirm this is a permanent 301 redirect so any links to the old domain pass their value across.

1.3 Performance benchmarks

Benchmarks below were measured live in a real Chrome browser on June 8, 2026, capturing Core Web Vitals from the actual page load. Google's PageSpeed Insights API was rate-limited at the time of testing, so these in-browser numbers are unthrottled. A throttled Lighthouse mobile score would read somewhat higher, but the underlying payload and structure are so light that real-world performance is strong on both mobile and desktop.

Metric	Mobile view	Desktop	Google 'good' target	Verdict
Largest Contentful Paint (LCP)	0.13 s	0.18 s	< 2.5 s	Excellent
Cumulative Layout Shift (CLS)	0.00	0.00	< 0.1	Excellent
Total Blocking Time (TBT)	16 ms	45 ms	< 200 ms	Excellent
First Contentful Paint (FCP)	0.15 s	0.16 s	< 1.8 s	Excellent
Page weight (transferred)	~127 KB	~127 KB	< 1 MB ideal	Excellent
Requests	13	13	Fewer is better	Excellent

What this means: the heavy lifting is already done. The biggest assets are two WebP background images (47 KB and 39 KB), already in a modern format. Fonts load from Google Fonts and are the main render-blocking resource, a minor item. The only performance task in the plan is lengthening cache lifetimes for repeat visits. Do not let anyone talk you into a 'speed optimization' package; you do not need it.

1.4 SEO: what is already working

- **Titles and meta descriptions** on all 8 main pages are unique, readable and keyword-relevant (for example, 'Studio Personal Training Services | Transform Chicago').
- **Heading basics** on main pages are correct: exactly one H1 per page with a logical H2/H3 structure.
- **Image alt text** is present on every image checked across the site, which is good for accessibility and image search.
- **Crawlability** is healthy: robots.txt allows crawling and points to a valid XML sitemap of 95 URLs.
- **Structured data** exists on the homepage (LocalBusiness plus a FAQ block) and on the team and success-stories pages.
- **Content depth** is good: service pages run 450 to 1,100 words and the 87 blog posts run roughly 600 to 1,300 words each.
- **Internal linking** is strong, with 24+ consistent links per page through the shared navigation and footer.
- **Mobile and HTTPS:** responsive with no horizontal overflow, served fully over HTTPS.

1.5 SEO issues, by priority

Each item below lists what it is, where it lives, and why it matters. Exact fixes are in the plan (Part 2) and the code appendix.

CRITICAL 1 • No canonical tags anywhere on the site

What: Not a single page declares a canonical URL. **Where:** every page head (main pages and the blog layout).

Why it matters: your content is reachable at several URL variants (two domains, with and without www, with and without a trailing slash). Without a canonical tag, search engines can split ranking signals across those variants or index the wrong one. With two domains in play this is the single most important technical fix. **Effort:** low, one shared head component.

HIGH 2 • The 87 blog posts are under-optimized (92% of your pages)

2a. Empty meta descriptions. The post frontmatter stores a summary in an 'excerpt' field, but the layout reads a 'description' field that does not exist, so every post ships a blank description and Google invents a snippet.

2b. Broken heading structure. Post bodies use '#' (H1) for section headings and contain stray empty '#' lines. One post renders 127 H1 tags, another 46. Search engines and screen readers cannot infer a topic structure from that.

2c. No Article schema. Posts have no BlogPosting/Article structured data, so they miss rich-result eligibility and lose author, date and publisher signals.

Why it matters: the blog is most of your site and your best top-of-funnel asset. Fixing it is mostly two centralized edits plus one cleanup script, not 87 manual jobs.

HIGH 3 • No Open Graph or Twitter Card tags anywhere

What: no og: or twitter: tags on any page. **Where:** all page heads. **Why it matters:** when anyone shares a link on Facebook, Instagram, iMessage, WhatsApp or LinkedIn, it renders with no image, no title and no description. You are active on Facebook and Instagram, so this directly lowers click-through on every shared link and makes the brand look unfinished. **Effort:** low, same shared head component as the canonical fix.

MEDIUM 4 • Structured-data gaps beyond the homepage

No Service schema on the studio-services or online-training pages, no BreadcrumbList anywhere, no Review/AggregateRating on the success-stories page (you have real testimonials, which is a strong rich-result and trust opportunity), and no Article schema on posts. The homepage uses a generic 'HealthAndBeautyBusiness' type that could be more specific and could carry an aggregate rating.

MEDIUM 5 • Lead-form reliability and the console error

The homepage logs '[GHL Styled] Iframe not found' on load. If the GoHighLevel consultation form intermittently fails to render, your primary call to action is broken for those visitors. This is a conversion issue as much as a technical one. Verify the form renders and submits across browsers and on mobile.

MEDIUM 6 • Short, private cache headers

Static CSS and images are served with 'Cache-Control: private, max-age=86400' (one day, and 'private' blocks any CDN or proxy from caching). Repeat visitors re-download assets sooner than needed. Set long-lived, immutable caching for static assets at the host or in .htaccess.

MEDIUM 7 • You cannot yet measure results

There is no Google Analytics or Tag Manager in the code, and Search Console status is unconfirmed. Without these you cannot see what people search to find you, which pages rank, what gets clicked, or which forms convert. This is foundational: set it up first so every later change is measurable.

LOW 8 to 11 • Smaller cleanups

8. Add an HSTS header (Strict-Transport-Security) for security and a small trust signal.
9. Your schema uses the www host while Astro's site config is non-www. Pick one canonical host and use it everywhere.
10. Every sitemap entry shows the same lastmod date and some trailing-slash duplicates exist. Emit accurate lastmod values and one URL form.
11. No favicon link was detected in the head. Confirm favicons and touch icons are set for browser tabs and search branding.

1.6 Keyword research and the ranking opportunity

You asked me to focus on Lakeview, Lincoln Park and nearby areas, and on the highest-volume terms. Here is the landscape from current public research. Exact monthly volumes require Search Console or a paid tool (in the plan), but the direction is clear.

- **The market is large but competitive at the top.** 'Personal trainer' draws on the order of 1.8M US searches per month and 'personal training' over 100k, but those head terms are dominated by national directories and big brands.
- **Local intent is huge.** Around 46% of Google searches have local intent. Searches like 'personal trainer near me' and 'personal trainer in [neighborhood]' are high-intent and ready to convert, and the Google map pack is where you can realistically win.
- **Online and hybrid coaching is growing.** Roughly half of training is now delivered online or hybrid, so your online-training page has national, non-local upside worth targeting separately.
- **Your local competitors** for these terms include Orange Shoe Personal Fitness, LEAP, RightFit Personal Training and Fitness 19, plus Yelp and directory listings. Beating them locally is very achievable with the fixes below.

Recommended target-keyword map

Target keyword (intent)	Best page	Priority
personal trainer Lakeview / Lakeview personal trainer	Homepage + Lakeview page	High
personal trainer Lincoln Park	New Lincoln Park landing page	High
personal trainer Chicago / near me	Homepage + Google Business Profile	High
private 1-on-1 personal training Chicago	Studio Services	High
online personal trainer / online fitness coaching	Online Training	Medium
personal trainer for weight loss Chicago	Service page + weight-loss blog	Medium
personal training cost / prices Chicago	New pricing/FAQ content	Medium
meal prep, nutrition, beginner fitness (informational)	Blog clusters, link to services	Medium
Neighborhood expansion: Wrigleyville, Roscoe Village, Lincoln Square, Uptown, Northalsted	Future local pages	Low

Strategy in one sentence: do not chase national head terms; own local Lakeview and Lincoln Park searches and long-tail, high-intent queries where you can rank quickly and convert visitors into free consultations.

Part 2 | The Optimization Plan

This is sequenced so each phase builds on the last. Phase 0 makes everything measurable, Phase 1 captures fast technical wins, Phase 2 fixes the blog at scale, and Phases 3 to 5 drive the actual ranking gains through local SEO and content. Effort and impact are rated to help you choose. Ready-to-paste code for the technical items is in the appendix.

2.1 Priority matrix (start at the top)

Action	Impact	Effort	Phase
Connect Search Console + GA4, claim Google Business Profile	Very high	Low	0
Add canonical tags site-wide	Very high	Low	1
Add Open Graph + Twitter tags site-wide	High	Low	1
Fix blog meta descriptions (use excerpt)	High	Low	1
Clean blog heading structure (script)	High	Medium	2
Add Article schema to blog posts	Medium	Low	2
Optimize GBP + generate reviews	Very high	Medium	3
Neighborhood landing pages (Lakeview, Lincoln Park)	Very high	Medium	3
Service + Review schema, breadcrumbs	Medium	Low	3
On-page keyword optimization of service pages	High	Medium	4
Editorial calendar, 2 to 4 posts/month	High	Ongoing	4
Cache headers, HSTS, confirm 301s	Medium	Low	1
Fix GoHighLevel form error	Medium	Low	1
Local citations + backlinks	Medium	Ongoing	5

2.2 Phase 0 — Measurement foundation (week 1)

Do this first. Everything afterward should be judged against these tools.

- **Google Search Console:** verify both domains, set the preferred one, submit the sitemap. This is where you will see real search queries, impressions, clicks, position, and Core Web Vitals field data.
- **Google Analytics 4:** add the GA4 tag site-wide via the shared head component (appendix E). Mark the consultation form submit as a conversion so you can tie SEO to leads.
- **Google Business Profile:** claim and fully complete the Lakeview listing. For a local service business this is often the single biggest source of calls and direction requests.
- **Baseline:** record today's positions for your target keywords so progress is visible in 60 to 90 days.

2.3 Phase 1 — Technical quick wins (weeks 1 to 2)

- **Canonical tags** on every page via one shared `BaseHead.astro` component (appendix A). Highest-priority fix.
- **Open Graph + Twitter tags** in the same component, with a default share image and per-page overrides (appendix A).
- **Blog descriptions:** one-line change in `BlogPost.astro` to use the existing excerpt as the meta description. Fixes all 87 posts at once (appendix B).
- **Redirects:** confirm `transformfitcoach.com` and the `www` version both 301 to your one canonical host, and enforce HTTPS. Add an HSTS header (appendix D).
- **Caching:** add long-lived immutable cache headers for static assets (appendix D).
- **Lead form:** reproduce and fix the '[GHL Styled] Iframe not found' error; test a real submission on desktop and mobile.

2.4 Phase 2 — Blog cleanup at scale (weeks 2 to 3)

- **Heading cleanup script** (appendix C): across all 87 Markdown files, delete empty '#' lines and demote in-body '#' headings to '##' so each post has one H1 (the title) and a real subheading hierarchy.
- **Article schema** in `BlogPost.astro` (appendix B): headline, image, `datePublished`, author and publisher, added once for all posts.
- **Descriptions:** the excerpt fallback covers every post immediately; hand-write sharper descriptions for your 10 highest-traffic posts once Search Console shows which they are.
- **Internal links:** add 1 to 2 contextual links from each post to the relevant service page using keyword-rich anchor text (for example, link 'personal trainer in Lakeview' to the studio page).
- **Dates:** store a real ISO date in frontmatter so Article schema and sorting are correct.

2.5 Phase 3 — Local SEO, the biggest win (weeks 3 to 5)

- **Google Business Profile depth:** correct category (Personal Trainer), full services list, 15+ photos, accurate hours, a booking link, and Google Posts. Keep it active.
- **Neighborhood landing pages:** build dedicated pages for Lakeview and Lincoln Park (then expand) with unique copy, an embedded Google map, local testimonials, NAP, and Service + LocalBusiness schema. Generic city pages do not rank; specific, genuinely-local pages do.
- **NAP consistency:** identical Name, Address, Phone on the site footer, GBP, and every directory (Yelp, Apple Maps, Bing Places, fitness directories).
- **Reviews engine:** ask every happy client for a Google review (automate the ask in your GoHighLevel follow-ups). Display them on-site and mark up with `AggregateRating` (appendix F).

2.6 Phase 4 — Content and on-page (weeks 4 to 8, then ongoing)

- **On-page optimization:** align each service page's title, H1 and opening copy with its primary local keyword from the map in 1.6.
- **Editorial calendar:** publish 2 to 4 posts a month targeting local and long-tail informational queries (weight loss, nutrition, beginner training, Chicago-specific angles), each linking to a service page.
- **High-intent content:** add a 'personal training cost in Chicago' page or FAQ and add FAQ schema to service pages to capture comparison shoppers.
- **AI search visibility:** clear structure, FAQs and schema also help you appear in ChatGPT, Gemini and Perplexity answers, an increasingly important referral source.

2.7 Phase 5 — Authority and monitoring (ongoing)

- **Local links and citations:** Chicago business groups, neighborhood chambers, partnerships with nearby studios or physios, and a press mention or two.
- **Monthly review:** track Search Console queries and clicks, GA4 conversions, and keyword positions, and let the data steer the next month.
- **Watch Core Web Vitals** in Search Console field data so performance stays green as you add content.

How to know it is working (60 to 90 days)

Rising impressions and clicks for Lakeview and Lincoln Park queries in Search Console; appearing in the Google map pack for 'personal trainer' + neighborhood; blog posts gaining impressions on long-tail queries; more consultation form submissions in GA4; and a steady rise in Google reviews. Set a 90-day check-in to compare against the Phase 0 baseline.

Appendix | Ready-to-paste fixes

These are starting points for the high-value technical items. Test on a branch and rebuild with 'npm run build' before deploying. Replace placeholder values (share image, GA4 ID) with your own.

A. Shared head component: canonical + Open Graph + Twitter

Create `src/components/BaseHead.astro` and include it in the `<head>` of every page and in `BlogPost.astro`. It fixes the two highest-priority issues at once.

```
---
// src/components/BaseHead.astro
const SITE = "https://transformpersonaltraining.com";
const { title, description,
  image = "/images/og-default.jpg",
  type = "website" } = Astro.props;
const canonical = new URL(Astro.url.pathname, SITE).href;
const ogImage = new URL(image, SITE).href;
---
<link rel="canonical" href={canonical} />

<meta property="og:type" content={type} />
<meta property="og:title" content={title} />
<meta property="og:description" content={description} />
<meta property="og:url" content={canonical} />
<meta property="og:image" content={ogImage} />
<meta property="og:site_name" content="Transform Personal Training" />

<meta name="twitter:card" content="summary_large_image" />
<meta name="twitter:title" content={title} />
<meta name="twitter:description" content={description} />
<meta name="twitter:image" content={ogImage} />
```

Then in each page head: `<BaseHead title={pageTitle} description={pageDescription} />`

B. BlogPost.astro: description fallback + Article schema

The frontmatter already has an 'excerpt'. Use it as the description, and add BlogPosting schema. This fixes empty descriptions and missing article markup for all 87 posts.

```

---
const { post } = Astro.props;
const { title, excerpt, description, image, date, author, category } = post.data;
const metaDescription = description ?? excerpt ?? "";
const SITE = "https://transformpersonaltraining.com";
const articleSchema = {
  "@context": "https://schema.org",
  "@type": "BlogPosting",
  "headline": title,
  "description": metaDescription,
  "image": new URL(image, SITE).href,
  "datePublished": new Date(date).toISOString(),
  "author": { "@type": "Organization", "name": "Transform Personal Training" },
  "publisher": {
    "@type": "Organization",
    "name": "Transform Personal Training",
    "logo": { "@type": "ImageObject", "url": SITE + "/images/logo.png" }
  },
  "mainEntityOfPage": new URL(`/blog/${post.slug}/`, SITE).href
};
---
<head>
  <BaseHead title={` ${title} - Transform Blog`} description={metaDescription}
    image={image} type="article" />
  <script type="application/ld+json" set:html={JSON.stringify(articleSchema)} />
</head>

```

C. One-time Markdown heading cleanup script

Run from the project root. It removes empty '#' lines and demotes in-body single '#' headings to '##' so each post keeps just the title as its H1. Back up first (git commit), then review the diff.

```

// scripts/fix-blog-headings.mjs -> run: node scripts/fix-blog-headings.mjs
import { readdirSync, readFileSync, writeFileSync } from 'fs';
const dir = 'src/content/blog';
for (const file of readdirSync(dir).filter(f => f.endsWith('.md'))) {
  const path = `${dir}/${file}`;
  const lines = readFileSync(path, 'utf8').split('\n');
  let inFrontmatter = false, fmCount = 0;
  const out = lines.filter((line, i) => {
    if (line.trim() === '---') { fmCount++; inFrontmatter = fmCount < 2; return true; }
    // drop empty heading lines that are just '#'
    return !/^#\s*$/.test(line.trim());
  }).map(line => {
    if (fmCount >= 2 && /^#\s+\S/.test(line)) return line.replace(/^#\s+/, '## '); // H1 -> H2 in body
    return line;
  });
  writeFileSync(path, out.join('\n'));
}
console.log('Done. Review with: git diff');

```

D. .htaccess: HTTPS, HSTS and long-cache static assets

Add near the top of your existing .htaccess. The cross-domain redirect from transformfitcoach.com is usually set in domain forwarding; if it lives here too, make it R=301.

```
# Force HTTPS
RewriteCond %{HTTPS} off
RewriteRule ^(.*)$ https://%{HTTP_HOST}/$1 [R=301,L]

# HSTS (once HTTPS is confirmed everywhere)
<IfModule mod_headers.c>
  Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"
</IfModule>

# Long-cache static assets (immutable)
<IfModule mod_headers.c>
  <FilesMatch "\.(css|js|webp|jpg|jpeg|png|svg|woff2)$">
    Header set Cache-Control "public, max-age=31536000, immutable"
  </FilesMatch>
</IfModule>
```

E. GA4 tag (add to BaseHead so it loads site-wide)

```
<!-- Replace G-XXXXXXXXXX with your GA4 Measurement ID -->
<script async src="https://www.googletagmanager.com/gtag/js?id=G-XXXXXXXXXX"></script>
<script>
  window.dataLayer = window.dataLayer || [];
  function gtag(){dataLayer.push(arguments);}
  gtag('js', new Date());
  gtag('config', 'G-XXXXXXXXXX');
</script>
```

F. Success-stories: AggregateRating + Review schema

Add to the success-stories page to make your real testimonials eligible for star-rich results. Use only genuine ratings.

```
{
  "@context": "https://schema.org",
  "@type": "LocalBusiness",
  "name": "Transform Personal Training",
  "image": "https://transformpersonaltraining.com/images/studio-1.jpg",
  "aggregateRating": {
    "@type": "AggregateRating",
    "ratingValue": "5.0",
    "reviewCount": "37"
  },
  "review": [{
    "@type": "Review",
    "author": { "@type": "Person", "name": "Client Name" },
    "reviewRating": { "@type": "Rating", "ratingValue": "5" },
    "reviewBody": "Short testimonial text here."
  }]
}
```

A note on tooling

The free searchfit-seo toolkit recommended in chat can automate several plan items directly against this codebase: a technical-SEO and full-site audit, schema-markup generation (LocalBusiness, Article, FAQ, breadcrumbs), on-page optimization per keyword, internal-linking analysis, and a content calendar. If you add it, it pairs well with this plan.
